By The Numbers: GHS

DID YOU KNOW?

10 GHS Facts in 60 Seconds

- 1. GHS stands for the Globally Harmonized System of the Classification and Labelling of Chemicals.
- 2. It is a set of guidelines for ensuring the safe production, transport, handling, use and disposal of hazardous materials.
- 3. The GHS was developed by the United Nations, as a way to bring into agreement the chemical regulations and standards of different countries. In short, it is an international attempt to get everyone on the same page. The hope is that every country will incorporate the tenets of the GHS into their own chemical management systems with the goal of making the international sale and transportation of hazardous chemicals easier, as well as, making workplace conditions safer for all employees exposed to chemical hazards.
- 4. The U.S. officially adopted the GHS on March 26, 2012. OSHA's adoption is actually a revision of the Hazard Communication Standard to align with the GHS. OSHA calls this revision, HazCom 2012.
- 5. The GHS is not a global law or regulation— a common misconception it is a system. Think of it as a set of recommendations or collection of best practices. No country is obligated to adopt all or even any part of the GHS.
- 6. Countries can pick and choose those pieces of the GHS they wish to incorporate into their own regulations (this is called the building block approach). Each adopting country is solely responsible for its enforcement within its jurisdiction.
- 7. To date, over 65 countries have adopted GHS or are in the process of adopting GHS.
- 8. The most noticeable changes brought by GHS for most organizations will be changes to safety labels, safety data sheets, and chemical classification.
- 9. As an example, the GHS refers to safety data sheets as SDSs, dropping the M from material safety data sheets (or MSDSs) as most American companies are used to. The GHS also standardizes the content and formatting of SDSs into 16 sections with a strict ordering. Labels also look quite different, with 6 standardized elements that include specific language depending upon chemical classification.
- 10. GHS is meant to be a logical and comprehensive approach to:
 - 1. Defining health, physical and environmental hazards of chemicals (although environmental hazards are outside OSHA's jurisdiction)
 - 2. Creating classification processes that use available data on chemicals for comparison with the defined hazard criteria
 - 3. Communicating hazard information in a prescribed and uniform way on labels

and safety data sheets

Over 30 million American workers are exposed to hazardous chemicals in their workplaces. The Occupational Safety and Health Administration's (OSHA) Hazard Communication Standard (HCS) is intended to ensure that these workers and their employers are informed of the identities of these hazardous chemicals, associated health and safety hazards, and appropriate protective measures. The HCS covers some 650,000 hazardous chemical products found in over three million establishments.

Since the HCS was adopted 20 years ago, the availability of chemical information in workplaces has increased dramatically, and the provision of labels and MSDSs with products has become a standard business practice. Surveys have shown that employers rely on MSDSs to select less hazardous substitutes, as well as to help them identify appropriate protective measures. In addition to these workplace uses of hazard information, MSDSs have evolved into sources of information on other aspects of chemical use.

While the standard's successes are evident, there are concerns regarding the quality of information disseminated under the HCS, in particular, whether the information is consistently accurate on MSDSs. This review examines the...
